

# Creating a Healthier Environment to Work In

There are numerous benefits that come from having an indoor air purifier in your home: the air quality is higher, you breathe easier, you feel healthier etc. However, an air purifier can be just as beneficial, if not more so, for a working environment.

What does an air purifier do? It traps harmful particles that are in the air and you are at risk of inhaling them. In an average household, this usually refers to dust, pollen, molds and dander from animals. However, in an office environment this can include many other pollutants and irritants that can come from various chemicals and other substances that can be found around the workplace. It really depends on the line of work you are in but some people are definitely more at risk than others.

## What an Air Purifier Can Do

Obviously, any place where chemicals and various substances that emit noxious fumes are used would really benefit from an air purifier. Usually, there are already health standards put in place that limits the exposure of humans to these harmful substances, but minute particles can still get airborne and make their way into our systems. The best way to deal with this is with an HEPA filter air purifier such as the Airgle MultiGas Air Purifier AG950. It features the latest cHEPA technology which allows for very thorough air cleaning that traps even the smallest of harmful air particulates. The reason why a workplace air purifier with a HEPA filter is much better than any other alternative is the fact that it is capable of trapping particles that can be as small as 0.3 microns. Seeing as how most typical harmful pollutants range from 1 to 5 microns in size this air purifier is guaranteed to leave a workplace much cleaner than it was before.

If you are an employer, you should seriously consider installing such a device in your place of business. From a pure practical standpoint, it is good for business because it raises efficiency and productivity. You do not need to worry anymore about employees getting sick and taking days off due to contracting various medical conditions from the harmful particles floating through the air that they inhale.

## Workplaces at Risk

Offices would benefit greatly from the presence of a HEPA air purifier. This is mainly due to two reasons: first off, there is generally a large concentration of people for a small work area, thus increasing the chances of people getting ill. Secondly, there are plenty of supplies commonly found around an office that can give off harmful airborne pollutants or irritants such as toners and solvents.

Artists are also at risk due to the fact that they work with various materials that contain harmful chemicals such as paints, adhesives and oils. An artist is also likely to spend a fair amount of time in his workplace so a HEPA filter air purifier can ensure that the room has a high degree of air quality.
